

**Question:** How are we becoming interconnected with technology biologically?

The world is changing constantly. Technology is evolving and biotechnology is a rising study. If more people pay more attention to it, it could save humanity as a whole and push it to a different level. Things like stem cells and creating limbs that regrow. It can allow us to study our ancestry of the earth, humans and other organisms. The history lies in the DNA. People can read illnesses through DNA. We will be able to heal diseases and prevent sickness. I think it can be used for both good and bad. But regardless of which, it is a field that needs to be studied by everyone.
